

CS110 · WEEK 4

Pathway selection receipt

P1 — Company Blog

Receipt ID	Selected (UTC)	Status
CS110-W04-P1-7412AA93	2026-09-17T19:49:10.495Z	Pathway selected

Keep this receipt with your project submission. It records your pathway and requirements; project completion has not been checked.

Your assignment requirements

1. R1 · 4A · Build your Company Blog website foundation and start GitHub

Open the “Videos, written guide, and starter” section on your requirements page. Follow the assigned 4A video segments and written guide to connect the project site. Create or continue the course GitHub repository, commit the working foundation, and push the 4A checkpoint. Confirm your selected pathway, but save its full content build for 4B.

2. R2 · 4A · Connect and inspect your Company Blog 3D page

Add a working Babylon.js page to the same website. Link to the 3D page and back to your Company Blog site. With the class, identify the engine, scene, camera, light, sphere, and ground. Record one prediction, change, and result. Keep Week 3 intact.

3. R3 · 4B · Add your Company Blog content and customize the code

Continue the Kairova course story with a blog for a company in that world. Write a company post explaining its work and how your 3D view helps its audience. Make and explain one scene change. Use your Company Blog context in a console message and a visible text update. Keep HTML, CSS, and JavaScript connected. Commit and push the 4B revision to the same GitHub repository. Another 3D object is optional.

4. R4 · 4B · Complete Workbook Section 5 for your Company Blog project

You may read and discuss Workbook Section 5 with a group. Every learner must complete questions 22–29 in their own workbook and submit their own pages. Use the back of Attention First: Workbook Section 5, “PEEK, Split-Attention, and Entry Design,” with your selected pathway as the context. Map the world or situation first, then identify the opening PEEK, intended state, attention risks, re-entry, visuals or UI, data or variables, and logic or conditionals. Save your completed pages as a PDF or clear photos and add a photo of your class whiteboard or planning board. Put your files in Pathway Reviews/Workbook-Section-5, then commit and push them to GitHub.

5. R5 · 4B · Record your Company Blog experiments

In TestNotes.txt, record your prediction, changed code or value, observed result or error, and next test. Include changes and future ideas for your Company Blog project.

6. **R6 · 4B · Test your Company Blog**

Check both page links, the scene, narrow and wide layouts, keyboard navigation, and the browser console. Save your company-blog link in Pathway Reviews/README.md. P1 has no separate movie or article review post.

7. **R7 · WEEK 4 · Submit your Company Blog project, GitHub repository, and receipt**

After 4A and 4B, confirm the finished project, Workbook Section 5 evidence, and pathway evidence are committed and pushed to the course GitHub repository. Download your selection receipt and save it in Pathway Reviews with your choice and content link in README.md. Submit the tested GitHub repository URL, website link, direct 3D-page link, and receipt through the CS110 Week 4 Canvas assignment. Use the repository visibility or access settings directed by your instructor. Both Action Records must be accepted before the weekly assignment is accepted for grading. Follow Canvas for submission instructions.

Submit through the [Week 4 assignment in your CS110 Canvas course](#). Selection receipt · requirements version 2026-09-17-live-v5. This receipt records your selection and requirements. It does not verify completion or award a grade.
